Worksheet W2: MVP and First Experiment

Module 2 · Minimum Viable Product Team: Police Crime Management system Date: 15-09-2026

Deliverable before Module 3: this sheet completed, with an experiment ACTUALLY RUN and its result reported — whatever the result says. A negative result reported honestly scores full marks; an unrun experiment scores nothing. Carry forward the problem, segment and multipliers from Worksheet W1.

Part 1 — Carry forward from W1

1.1 The problem (from W1, 1.1) — restate it, still without naming any solution.

Police station Writers spend significant time manually collecting, writing, correcting and typing complaints, especially when complainants are unable to write the complaint clearly or make spelling mistakes.

1.2 The beachhead segment (from W1, 1.2), tightened by anything you learned since:

Police station Writers who are responsible for receiving, documenting and registering citizen complaints.

1.3 Which multiplier from your W1 market size do you trust least? (W1, 4.3) — this is a candidate for your riskiest assumption below.

The number of police stations that would regularly use or adopt a new complaint-documentation process.

Part 2 — Value proposition canvas

Fill the right side (customer profile) *only* from interview verbatims. Then fill the left side, and draw a line from every reliever/creator to the pain/gain it answers. Anything unmatched is waste — cross it out.

VALUE MAP

Products / Services

AI-Assisted Police Complaint Documentation System

Customer Pain	MVP Feature / Response
Complaint writing takes time	Voice input + automatic draft generation
Complainants may not know how to write	Voice-based complaint input
Complaint is given as an unstructured story	Basic information extraction
Important information may be missing	Missing-information detection
Writer has to ask additional questions	Suggested Writer questions
Manual typing increases workload	Speech-to-text + structured draft

Gain Creators

- Converts spoken complaints into text.
- Extracts basic complaint information.
- Generates a structured complaint/CSR draft.
- Preserves the original complaint statement.
- Helps the Writer identify missing information.

CUSTOMER PROFILE

Customer jobs:-

- Receive complaints from citizens.
- Ask the complainant for necessary details.
- Write/type the complaint in the required format.
- Correct spelling and wording when required.
- Prepare the complaint/CSR documentation.

Customer pains:-

- Complaint writing takes considerable time.
- Some complainants do not know how to write their complaint.
- Complaints are often given as natural, story-like explanations.
- The Writer has to ask questions and collect missing information.
- Spelling mistakes and incorrect writing may require rewriting.
- Manual typing and documentation increase the Writer's workload.

Customer gains:-

- Faster complaint documentation.
- Less manual writing and typing.
- Easier handling of complaints given verbally.
- Better organization of complaint information.
- Reduced effort in preparing the initial complaint draft.

• Allows Writer review and approval.	Ability to review the complaint before final approval.

2.1 Unmatched items. List anything on the left with no partner on the right (be honest — this is usually a feature someone on the team is fond of):

Customer gain not fully addressed:

- Complete reduction of documentation workload cannot yet be guaranteed because Writer verification is still required.

Customer pain not fully addressed:

- The current MVP does not always extract every detail correctly, particularly location, description and some natural Tamil expressions.

Part 3 — Value proposition statement

3.1
For police station Writers who spend significant time manually writing and correcting citizen complaints, our AI-assisted complaint documentation system provides a faster and more structured way to prepare complaint drafts, unlike their current workaround of manually asking, writing, correcting and typing the complaint.

3.2 Benefit check. Rewrite your "key benefit" as the customer would say it, describing progress in their life — not what your product does:

"I can prepare a complaint draft faster without manually typing the entire complaint, while still checking and approving the information myself."

Part 4 — Segment and archetype

QUESTION	YOUR ANSWER
SHARED JOB	Receive complaints and prepare/type the complaint record accurately.
SHARED PAIN	Manual complaint writing/typing takes about 1 hour and requires rewriting when complainants make writing or spelling mistakes.
SHARED WAY TO PAY	Through the **Police Department / authorized police administration**.
WHO IS THE USER?	Police Station Writer
WHO FEELS THE PAIN?	Police Station Writer
WHO SIGNS/PAYS?	Police Department/ Authorized Police Authority
WHERE WOULD THEY HEAR OF YOU?	Through **official police department channels, station-level demonstration, or department approval**.

4.1 Market type (circle one): existing / resegmented / new / clone — and in one line, what that choice means for what your MVP must test:

Resegmented

The MVP improves an existing police complaint documentation activity through voice-based and evidence-preserving documentation.

Part 5 — Rank your assumptions

List five things that must be true for this business to work. Score each 1–5 on *how fatal if wrong* and *how uncertain we are*. The highest combined score is your next experiment.

Assumption	Fatal (1–5)	Uncertain (1–5)	Total
1. Writers will find voice-based complaint entry useful.	5	4	9
2. Voice-to-text can capture the complainant's statement accurately enough for Writer review.	5	5	10
3. Writers will trust a system that preserves the original complaint statement.	5	4	9
4. The system can reduce the time required to prepare a complaint draft.	4	4	8
5. Writers can review and approve the generated draft before official use.	4	3	7

5.1 The riskiest assumption (highest total), in one sentence:

Voice-to-text can capture the complainant's statement accurately enough for the Writer to review and prepare the complaint draft without introducing unsupported information.

Part 6 — Design the experiment (plan backwards)

6.1 LEARN — what do we need to learn?

We need to learn whether police Writers can use voice-based complaint input to prepare a structured complaint draft with less manual documentation effort while preserving the complainant's original information.

6.2 MEASURE — the hypothesis, with a threshold and a date. Write it before you build anything.

We believe police station Writers will be able to use the prototype to prepare complaint drafts from spoken complaints.

We will know this is true when at least 4 out of 5 test complaints can be converted into a usable structured draft that the Writer can review without unsupported facts being added.

6.3 BUILD — which MVP produces that number? Circle: landing page / concierge / Wizard of Oz / explainer video / pre-order or pilot / single-feature build

Describe it in two lines — and state what you are deliberately *not* building:

We built a simple MVP where the complainant can enter a complaint using Tamil voice input. The system converts speech to text, extracts basic information, identifies selected missing information, generates a structured complaint draft and allows the Writer to review and approve it.

6.4 Metric check. Is your metric actionable (points to a decision), accessible (the team understands it), and auditable (traceable to named customers)? If any answer is no, fix the metric now:

Metric: Usable Draft Rate = Number of usable complaint drafts ÷ Total complaint test cases × 100

Actionable: Yes — if the rate reaches **70% or above**, we can continue; if it is below 70%, we need to improve the MVP.

Accessible: Yes — the team can easily calculate it by counting usable drafts and total test cases.

Auditable: Partially / No — our current experiment used test cases rather than named real customers. To make it fully auditable, each test should be linked to a named Writer/test participant and the corresponding output evidence.

Part 7 — Run it, and report

7.1 What actually happened. The number, not the impression:

The experiment was conducted using **5 complaint test cases** with different complaint scenarios. The system successfully accepted the complaint input, preserved the original complaint statement, and generated a Police Complaint / CSR draft in all 5 cases.

7.2 Threshold met? YES / NO — and what surprised you (there is almost always something the plan did not anticipate):

Pre-defined threshold: At least **70% of test cases should produce a usable complaint draft**.

Actual result: 60% (3 out of 5 cases)

Therefore, the experiment **did not meet the 70% threshold**.

7.3 Decision: persevere or pivot? Circle one and defend it in two sentences using only the number from 7.1.

PERSEVERE / **PIVOT** (type: customer segment / customer need / zoom-in / zoom-out / platform / business model)

Decision: Pivot / Improve the MVP before continuing.

The experiment indicates that the basic complaint documentation workflow works, but the information extraction needs improvement before relying on it for more complaint cases.

7.4 The next riskiest assumption you carry into Module 3:

Next riskiest assumption:

The system can accurately extract important complaint information such as date, time, location, incident type, object and

---

Marking guide (for instructor): VP canvas filled from real verbatims, unmatched items admitted (2); statement names a workaround not a competitor (1); segment shows job/pain/payment and separates user from signer (2); assumptions ranked and riskiest correctly identified (1); hypothesis falsifiable with threshold set in advance (2); experiment actually run and result reported honestly (2). Total 10. Deduct nothing for a failed hypothesis; deduct fully for a threshold written after the fact.
